

Beltsiflex® cross-rigid sidewall belts

31

HOT VULCANISED SIDEWALL CONVEYOR BELTS

Beltsiflex® sidewall belts have been developed mainly for very steep angle conveying applications, up to a gradient of 90° (vertical plane).

As highly flexible conveyor belts, they facilitate switching from horizontal to inclined conveying and can be adapted to different layouts or arrangements to suit the needs of our customer's applications.

Beltsiflex® sidewall belt increases transport capacity up to 4 times compared to other types of traditional belts of the same width.

It saves space by allowing the vertical conveying of materials.

This system allows for an economic structural installation, since it provides a single means of conveying materials, depending on the elevation height, where at least three conventional conveyors would have been necessary otherwise.

Multiple rubber cover grade options are available to suit the nature of the product to be transported and the environment within which the belt operates.
